This work was funded by the European Commission Ricardo plc were the project leaders

- 1. Overview
- 2. Review findings
- 3. Conclusions & considerations

1. Overview

Purpose of the review – to determine the:

- Quality & reliability of Member State submissions
- Extent to which Member State projections predict compliance with emission reduction commitments.

Scope:

- SO₂, NO_X, NH₃, NMVOC, PM_{2.5}, (BC)
- 2025, 2030, (2040, 2050)
- All NFR codes
- Submissions made by 26th April *
- Initial checks, desk review, centralised review, review reports

2. Review findings

Submissions overview:

- Less than half of the Member States reported on time
- Some resubmitted 2021 projections datasets
- Some did not use an up-to-date reference year
- Projected compliance (2025) with 2020-2029 ERCs (out of 22)

	SO ₂	NOx	NMVOC	NH ₃	PM _{2.5}
Member States reporting compliance in 2025 under a WM scenario	22	20	20	17	21
Member States reporting compliance in 2025 under a WM and/or WAM scenario	22	21	20	21	22

Projected compliance (2030) with 2030+ ERCs (out of 22)

	SO₂	NO _X	NMVOC	NH₃	PM _{2.5}
Member States reporting compliance in 2030 under a WM scenario	21	15	17	12	16
Member States reporting compliance in 2030 under a WM and/or WAM scenario	22	19	19	19	21

2. Review findings

Overview of quality:

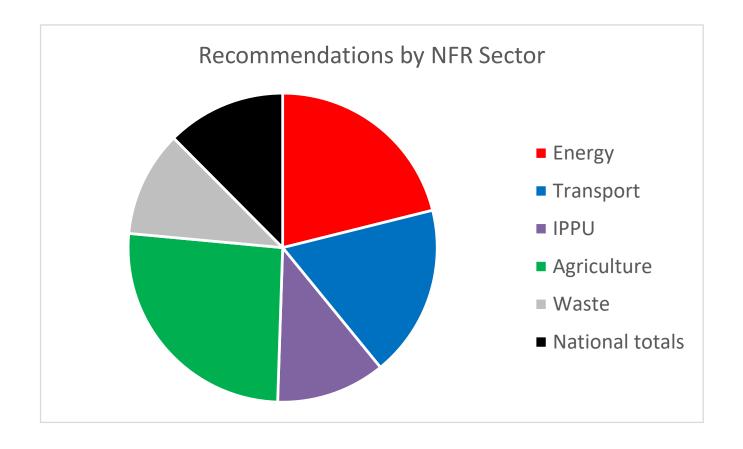

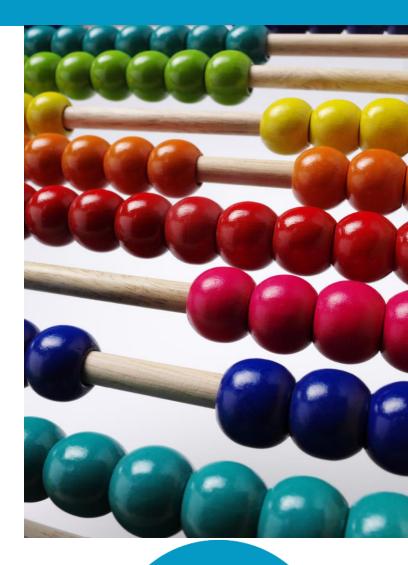

2. Review findings

Overview of recommendations:

3. Conclusions and considerations

Less than half of the Member States reported on time

 Would it help to have a larger gap between the submission dates for the emissions inventory and the projections?

Transparency remains a major quality issue for many Member States

 Would it help to update the IIR template? And/or provide clearer expectations regarding the reporting of methodological detail?

Accuracy - progress still needed for some Member States

Agriculture is the sector with most recommendations

 Can better guidance be provided on agriculture PaMs and reporting expectations?
